I received a request to add some functionality to one of the .ADP / SQL2005 Apps we are using.

The request deviates significantly enough from normal ops that I hesitate to pose the question here but need to start somewhere.

They want employees to use their badges to check out bar coded items. Setting up the forms and tables obviously is not a problem.

My question is this... does anyone have any experience they can share with:

1. using an RFID device to receive input and write it to a table
2. using a barcode reader to write to a table.

I apologize for posting to this NG but did not know of an 'Appropriate' NG to post to.

Thanks in advance,  
Bob.
