Hi all –

I have an orch that sends a message type System.String. (yes, still farting around with my strings) No probs, everything works great. Then a build of the orch project started yielding this error:

'System.String' must be Xml serializable to be a message part type --
check event log for more information

There was no error logged in the event log. It was working, now it's not, and I don't know what I could have done to make BT think that System.String isn't serializable. Thought all you needed to be XML serializable was to be serializable and have a default constructor.

I found this post indicating that a reboot might help.

http://groups.google.com/group/microsoft.public.biztalk.general/browse_thread/thread/1718bc73fb361de4/d27160e5d

So I rebooted my test environment, and everything worked OK for a while. Then it started failing again. The only thing I've been doing in the project is messing with promoted props and distinguished fields on a schema in my messaging project.

What are my next steps?

Thanks!

Jay
